AI TOOLS

Artificial Intelligence (AI) tools are being rapidly developed; many , like ChatGPT, are available online and can help people.

Just by typing text to tell the tool what you are trying to accomplish, these tools can:

write content

draw images

design graphics

Some AI tools will even generate a video when given a text description of what the video should look like.

How do you use ChatGPT?

ChatGPT works like a conversation.

Unlike Google, which gives you websites based on your search words, ChatGPT gives information as if someone was answering you based on their knowledge. You ask it questions, providing it with necessary background information, and it responds with informative answers.

You can **refine your question and give it more details**, in order to get more helpful responses.

Can we use ChatGPT to help with our Technovation Project?

Yes!
Here are some tips to remember when using AI tools:
- Don't assume it is giving you accurate information. Check everything yourself with a trustworthy source!
- Recognize AI's limitations. AI makes predictions based on what it's seen before. YOU are the expert on your own situation and YOUR ideas will be most unique!
- Do no harm with your solution, remember to always have a positive impact.

You do NOT have to use ChatGPT or any AI tools. It's simply another tool that could be helpful.

What are ways we could use Chat GPT and other AI tools in our project?

There are many ways you could use AI tools to assist you with your project. Here are some examples:

Ideation
- ChatGPT is great at giving you some different ideas around your community and the UN SDGs to focus on. Have it suggest solutions as a starting point to spark your own creative ideas, build on these ideas and customize them to your content.

Design
- Some AI tools, like Uizard, can help you design screens for your app or give you ideas for your logo.

Feedback
- Give ChatGPT your business or user adoption plan, then enter the judging rubric, and it will tell you how your project matches the criteria in the rubric!

Scripts
- You can ask ChatGPT to help you write what you want to say in your pitch and technical videos. Of course, the videos are all about your personal project, so you need to be part of the video yourself!

Coding
- Some AI tools, like OpenAI Codex, can help you write code. At this time, most only work with certain text-based languages, but it might help you learn some coding techniques and skills.

If you're using ChatGPT or AI tools, let Technovation know! It won't affect your score AT ALL. We just want to know who is using it and how.
